

AI Customer Capture System

Written Case Study — Product Showcase

Overview

Wright Automation Consulting is a freelance AI automation practice based in Washington, DC, focused on building practical automation systems for small service businesses in the Northern Virginia area. The AI Customer Capture System is the practice's first flagship product — designed, built, and tested independently before being offered to clients.

The Problem

Small service businesses operate in high-demand, low-margin environments. Owners are often the operator, the scheduler, and the customer service representative simultaneously. When a call comes in while they are actively working — on a job, with a client, or simply unavailable — it goes unanswered.

The consequence is straightforward: most callers do not leave voicemails and do not call back. They move on to the next option. For businesses that depend on inbound leads, each missed call represents direct, measurable lost revenue — and it happens multiple times per day.

The Insight

The problem is not that business owners are careless. It is that they are busy doing the work. No amount of effort or intention closes the gap between a ringing phone and an owner who is elbow-deep in a job. The only solution is a system that operates independently of the owner's attention — one that captures, responds, and logs leads automatically, around the clock.

The Build

The AI Customer Capture System was built using Zapier as the automation backbone, Quo as the business phone platform, ChatGPT (via OpenAI) for AI-powered message analysis and response, and Google Sheets as the lead tracking dashboard. No custom code was written. The system was assembled, configured, and tested entirely through no-code tooling.

The system consists of four automations:

Automation 1 — Missed Call Auto-Response

When Quo detects a missed incoming call, Zapier triggers an immediate outbound text to the caller's number. A filter step ensures the automation only fires on genuine missed calls, not outgoing messages — a critical safeguard discovered and corrected during testing when a looping error caused 100 consecutive outbound texts to fire before credits were exhausted. The fix: a filter condition placed before the send step that restricts triggers to incoming calls only.

Automation 2 — AI-Powered Text Response + Lead Logging

When a customer responds via text, Zapier captures the incoming message and routes it to ChatGPT. ChatGPT has been provided context about the business — services offered, pricing, availability, and tone — and generates a personalized, contextually appropriate reply. That reply is sent back to the customer via Quo. Simultaneously, the customer's contact information, message content, and timestamp are logged automatically to a Google Sheets dashboard. The owner receives an immediate notification.

Automation 3 — Owner Notification

Built into Automation 2, the owner notification ensures that while the system handles the initial response, the owner maintains full visibility. Every new lead that enters the system generates a real-time alert, allowing the owner to follow up personally when appropriate.

Automation 4 — Post-Payment Google Review Request

After a completed transaction is processed, Zapier detects the payment completion and triggers a follow-up text containing a direct link to the business's Google review page. This closes the customer journey loop — from initial contact to completed job to public review — without requiring any manual action from the owner.

Testing and Debugging

The system was tested end-to-end using simulated lead scenarios before any client deployment. Testing surfaced one significant issue: the missed call automation initially lacked a directional filter, causing outgoing texts to re-trigger the automation and create an infinite loop. This was identified, diagnosed, and resolved by inserting a filter condition that restricts automation execution to incoming messages only. The incident is documented as part of the build-in-public content series accompanying this product.

Pricing

Setup & Installation	Ongoing Monitoring
\$299	\$59 / month
Includes full system build, configuration, testing, and launch.	Includes monitoring, updates, AI response tuning, and technical support.

Current Status

The system is fully built, tested, and ready for client deployment. Outreach is underway across Northern Virginia service businesses. The first pilot client will be offered a 30-day trial in exchange for documented results — including missed call volume, response rate, leads captured, and conversion to booked appointments. Those results will be published as the full client case study.

Pilot Tracking Metrics

The following metrics will be captured during the pilot period:

Baseline (captured day 1)

- Missed calls per week (average)
- Current follow-up process
- Estimated leads lost per week

Ongoing (weekly)

- Missed calls detected by system
- Auto texts sent
- Customer response rate
- Leads logged in Google Sheets
- Leads converted to booked appointments

Primary success metric

- Leads recovered — the delta between leads that would have been lost and leads captured by the system
